

Integrating Unix-based Server Solutions into BitDefender Management Server

Quick Install Guide

BitDefender's security solutions for Linux, FreeBSD and Solaris servers (BitDefender Security for Samba, Security for Mail Servers) can be included into the Centralized Management platform by installing a separate add-on. The add-on can be installed at any time after installing BitDefender Management Server, without disturbing its operation.

Follow these steps to set up integration support of BitDefender's security solutions for Unix-based servers in BitDefender Management Server:

1. Install BitDefender Management Server on a Windows computer. Please refer to the BitDefender Management Server documentation for further information.
2. Install the BitDefender Management Server Unix add-on on the same Windows computer (either the 32-bit or the 64-bit version, depending on the computer platform).
3. Install BitDefender Security for Mail Servers and BitDefender Security for Samba on your Unix-based servers, as needed. Please check with the [BitDefender website](#) for the list of supported distributions.

The installation procedure is quite simple. For example:

```
# sh BitDefender-Security-Mail-3.1.2-linuxgcc3x-i586.rpm.run
```

At some point, you will be asked if you want to enable integration with BitDefender Management Server. Type **Y** and then press ENTER.

4. Configure the integration with BitDefender Management Server.
 - a. Specify the BitDefender Management Server host:

```
# cd /opt/BitDefender/bin
# ./bdsafe bdem host <host[:port]>
```

- b. Restart the product:

```
# cd /opt/BitDefender/bin
# ./bd restart
```

From this moment on, you should be able to see the installed solutions for Unix-based servers in the BitDefender Management Console.

You can disable integration with BitDefender Management Server at any time, using the following commands:

```
# cd /opt/BitDefender/bin
# ./bdsafe bdem enable N
# ./bd restart
```
